AMENDMENTS IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF THE CLAIMS:

- 1. (Currently amended) A method of controlling the usage by an attached function of network services associated with a network system that includes the attached function, one or more other attached functions and network infrastructure, the method comprising the steps of:
 - a. obtaining information associated with the network system;
 - b. setting one or more static policies for network services usage by the attached function;
 - c. setting one or more dynamic policies for network services usage by the attached function;
 - d. monitoring the network system for triggers; and
 - e. modifying <u>directly</u> by one or more devices of the network infrastructure <u>without</u> <u>manual intervention by a network administrator</u> the static policies, the dynamic policies, or both for the attached function based upon the detection of one or more triggers.
- 2. (Original) The method as claimed in Claim 1 further comprising the step of saving set and modified policies associated with the attached function as policy history for the attached function.
- 3. (Original) The method as claimed in Claim 2 further comprising the step of querying whether a policy history exists for the attached function after obtaining the information from the network system.
- 4. (Original) The method as claimed in Claim 2 wherein the step of saving set and modified policies associated with the attached function includes the step of caching some or all of the policy history in a network system device.

- 5. (Original) The method as claimed in Claim 4 further comprising the step of invalidating the cached policy history based upon the occurrence of a specified event.
- 6. (Original) The method as claimed in Claim 5 wherein the specified event is selected from the group consisting of time, size limitations, storage limits, a policy change, or a network system change.
- 7. (Original) The method as claimed in Claim 2 further comprising the step of evaluating whether the policy history includes any static policies that may be set for the attached function in a current session.
- 8. (Original) The method as claimed in Claim 1 wherein the triggers include timeouts, attached function changes, network infrastructure changes, intrusion detection events, firewall events, administrator inputs, network service changes and network service change requests.
- 9. (Original) The method as claimed in Claim 1 wherein the information includes attached function information, access device information, access port, number of devices per port, priority per port, priority per application, priority per device, application requested, exchange protocols available, port security, access location, and access time.
- 10. (Original) The method as claimed in Claim 1 wherein the only static policy is that there are only dynamic policies.
- 11. (Currently amended) A method of controlling the usage by an attached function of network services associated with a network system that includes the attached function, one or more other attached functions and network infrastructure, the method comprising the steps of:
 - a. obtaining information associated with the network system;
 - b. setting one or more dynamic policies for network services usage by the attached function;
 - c. monitoring the network system for triggers; and

- d. modifying <u>directly</u> by one or more devices of the network infrastructure <u>without</u> manual intervention by a network administrator the dynamic policies for the attached function based upon the detection of one or more triggers.
- 12. (Original) The method as claimed in Claim 11 further comprising the step of saving set and modified policies associated with the attached function as policy history for the attached function.
- 13. (Original) The method as claimed in Claim 12 further comprising the step of querying whether a policy history exists for the attached function after obtaining the information from the network system.
- 14. (Original) The method as claimed in Claim 12 wherein the step of saving set and modified policies associated with the attached function includes the step of caching the policy history in a network system device.
- 15. (Original) The method as claimed in Claim 14 further comprising the step of invalidating the cached policy history based upon the occurrence of a specified event.
- 16. (Original) The method as claimed in Claim 15 wherein the specified event is selected from the group consisting of time, size limitations, storage limits, a policy change, or a network system change.
- 17. (Original) The method as claimed in Claim 1 wherein the triggers include timeouts, attached function changes, network infrastructure changes, intrusion detection events, firewall events, administrator inputs, network service changes and network service change requests.
- 18. (Currently amended) A system to control the usage by an attached function of network services associated with a network system that includes the attached function, one or more other attached functions and network infrastructure, the system comprising:

- a. means, forming part of the network system, for obtaining information associated with the network system; and
- b. a dynamic policy <u>function</u> module of the network infrastructure for setting static and dynamic policies for the attached function, for monitoring the network system for triggers, and for modifying <u>directly by one or more devices of the network infrastructure</u> the static policies, the dynamic policies, or both for the attached function <u>without manual intervention by a network administrator</u> based upon the detection of one or more triggers.
- 19. (Original) The system as claimed in Claim 18 wherein the dynamic policy function module is a centralized module of a policy server of the network infrastructure.
- 20. (Original) The system as claimed in Claim 18 further comprising means for saving set and modified policies history.
- 21. (Original) The system as claimed in Claim 20 wherein the means for storing set and modified policies history forms part of the policy server of the network infrastructure.
- 22. (Original) The system as claimed in Claim 20 wherein the means for storing set and modified policies forms part of an interconnection device of the network infrastructure.
- 23. (Original) The system as claimed in Claim 18 wherein the dynamic policy function module is a distributed module forming portions of two or more devices of the network infrastructure.
- 24. (Original) The system as claimed in Claim 23 wherein the two or more devices are selected from a combination of one or more servers and one or more interconnection devices or a combination of two or more interconnection devices.
- 25. (Original) The system as claimed in Claim 20 wherein the means for saving set and modified policies includes means for caching the set and modified policies on a centralized network

device, a local network device, or a combination of a centralized network device and a local network device.

- 26. (Original) The system as claimed in Claim 18 wherein the means for obtaining information associated with the network system includes IEEE 802.1X authentication, RADIUS authentication, or a combination of IEEE 802.1X authentication and RADIUS authentication of the attached function.
- 27. (Currently amended) A system to control the usage by an attached function of network services of a network system that includes the attached function, one or more other attached functions and network infrastructure, the system comprising:
 - a. means, forming part of the network system, for obtaining information associated with the network system; and
 - b. a dynamic policy <u>function</u> module of the network infrastructure for setting dynamic policies for network services usage by the attached function, for monitoring the network system for triggers, and for modifying <u>directly by one or more devices of the network infrastructure</u> the dynamic policies for the attached function <u>without manual intervention by a network administrator based</u> upon the detection of one or more triggers.
- 28. (Original) The system as claimed in Claim 27 wherein the dynamic policy function module is a centralized module of a policy server of the network infrastructure.
- 29. (Original) The system as claimed in Claim 27 further comprising means for saving set and modified policies history.
- 30. (Original) The system as claimed in Claim 27 wherein the dynamic policy function module is a distributed module forming portions of two or more network devices of the network infrastructure.

Atty Docket No. ENI-048

31. (Original)	The system as	claimed in C	Claim 27 furt	her comprisir	ng means for	caching set	and
modified polic	ies history on o	one or more l	ocal networl	devices of tl	he network in	frastructure	: .
